The invention relates to an isolated mammalian anti-dual integrin antibody having at least one of the human heavy chain or light chain complementary determining region (CDR). HC CDR1-CDR3, LC CDR1-3). Also included are the nucleic acids encoding the CDRs, a vector comprising the nucleic acids a host cell comprising the vector, an anti-idiotype antibody that binds to the anti-dual integrin, a medical device comprising the antibody sultable for administration by parenteral, subcutaneous, intrandominal, intracapsular, intradronchial, intracapsular, intracartilaginous, intracalebellar, or other routes as given in specification. The antibody is useful for example, immune related disease such as rheumatoid antimal for example, immune related disease such as rheumatoid arthitis, gastric ulcer, asthma, allergic rhinitis, Crohn's pathology, sickle cell anaemia, diabetes, cardiovascular disease such as anthology, alckle cell anaemia, diabetes, cardiovascular disease such as bacterial, viral, and fungal infections preumonia, leprosy, malaria, malignant chases euch as leukaemia, chronic myelocytic leukaemia, burkitt's chases euch as leukaemia, chronic myelocytic leukaemia, burkitt's chases euch as multiple myeloma; neurological disease such as multiple cleares, cardiovascula disease such as multiple cleares, cardiovascula disease such as multiple cleares, cardiovascula disease such as multiple cleares, parkinson's disease, spinal ataxia, Alzheimer's disease, creutzfeldt-Jakob disease and many other diseases given in the
                                                                                                                                                                                                                                                                                                                                                                Human; antibody; dual integrin; CDR; heavy chain variable region; HC CDR; medical device; immune related disease; rheumatoid arthritis; gastric ulcer; asthma; allergic rhinitis; Crohn's pathology; sickle cell anaemia; diabetes; cardiovascular disease; arteriosclerosis; atherosclerosis; restenosis; angina pectoris; myocardial infarction; infectious disease; pneumonia; leprosy; malaria; malignant disease; neurological, disease; multiple sclerosis; Parkinson's disease; Alzheimer's disease; Creutzfeldt-Jakob disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated mammalian anti-dual integrin antibody, useful for diagnosing or treating dual integrin related condition such as rheumatoid arthritis, gastric ulcer, asthma, atherosclerosis, restenosis.

The invention relates to an isolated mammalian anti-dual integrin antibody having at least one of the human heavy chain or light chain complementary determining region (CDR, HC CDRI-CDR3, LC CDRI-3). Also included are the nucleic acids encoding the CDRs, a vector comprising the nucleic acids a lost cell comprising the vector, an anti-idiotype antibody that binds to the ant-dual integrin, a medical device comprising the antibody suitable for administration by parenteral, subcutaneous, intranscular, intravenous, intravenous, intravenous, intravenous, intraceleballar, or other routes as given in specification. The antibody is useful for diagnosing or treating a dual integrin related condition in an animal for example, immune related disease such as rheumatoid arteritis, gastric ulcer, asthma, allergic rhinitis, Crohn's pathology, eichle cell anaemia, diabetes, cardiovascular disease such as arteriosclerosis, atherosclerosis, restenosis, angina pectoris, myocardial infarction, infectious disease in a cell such as bacterial,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the heavy chain of an anti-tumour necrosis factor (TNF) antibody. The invention provides isolated human, primate, rodent, mammalian, chimeric, humanised and/or CDR-grafted anti-TNF antibodies, immunoglobulins, cleavage products and other specified portions and variants, as well as anti-TNF antibody compositions, encoding or complementary nucleic acids, vectors, host cells, compositions, formulations, devices, transgenic animals, transgenic plants, and methods of making and using them. The anti-TNF antibody comprises at least a portion of an immunoglobulin molecule, especially the heavy chain and/or light chain variable regions

given in AAM51165-66, or either all of the CDRs of the heavy chain (see AAM51165-60) or all of the CDRs of the light chain (see AAM51161-63). The antibody may inhibit TNF-induced cell adhesion molecules, inhibit TNF binding to receptor, or provide Arthritic Index improvement in a mouse model. It is useful for diagnosing or treating a TNF related condition in a cell, tissue, organ or animal (claimed) such as rheumatoid arthritis, ansemia, diabetes, a cardiovascular disease such as arteriosclerosis, atherosclerosis, restenosis, angina pectoris or myocardial infarction, an infectious disease in a cell such as bacterial, viral, and fungal infections, pneumonia, leprosy and malaria, a malignant disease such as leuksemia, chronic myelocytic leuksemia, Burkitt's lymphoma and multiple myeloma, or a neurological disease such as multiple surkingon's disease, spinal ataxia, Alzheimer's disease and Creutzfeldt-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; best cold tolerance; pathogen tolerance; pathogen tolerance; pathogen tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomanna; bacterial polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant source such as maize or soybean. The method of producing a transformed plant having an improved property comprises transformed plant, where the polymbrant DNA construct and growing the transformed plant, where the polymbrant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, introgen or providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved lighin production or improved galactonmanan production. This sequence represents a bacterial polypeptide used in the scome of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic format from USPTO at sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Antigenic peptide. The OMP A polypeptide stimulates IL-8 (interleukin-8) expression and crossreacts with an antibody that binds to the Acinetobacter OMP A protein. Also disclosed are antigenic peptides of the OMP A polypeptide. The OMP A polypeptide and antigenic peptides are useful for diagnosing or treating diseases including peptic ulcers, cancers, respiratory diseases, sepsis and other conditions. The OMP A polypeptide is also useful for preparing a vaccine in situations where an antibody is not required to cross an epithelial cell barrier to be effective. The present sequence represents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for producing an isomalto oligosaccharide which comprises reacting an enzyme that hydrolyses an alpha-1, 4-glycosade linkage on pullulan or panose in the presence of glucose. The method of the invention may be useful for producing an isomalto oligosaccharide to be used as a foodstuff material. The isomalto oligosaccharide by the method has reduced sweet taste and low calorie content, is non-fermentable, has a low bifidobacterium proliferation factor and is useful as a health food material. The current sequence is that of the Thermoactinomyces vulgaris alpha-amylase TVAII
                             The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinecbacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A. baumannii protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                isomalto oligosaccharide, alpha-1,4-glycoside linkage, pullulan, panose, glucose, foodstuff, low calorie, health food; alpha-amylase, TVAII; enzyme, bifidobacterium proliferation factor.
                  invention relates to isolated Acinetobacter baumannii nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Producing isomalto oligosaccharide for use in the food industry, comprises reacting an enzyme which hydrolyzes an alpha-1, 4-glycoside linkage on pullulan or panose in the presence of glucose.
                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                   ö

BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antithematic and antithDBs activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression
                                                                                                                                                                                                                                                                                               BLys; B lymphocyte stimulator; TNF superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; fimunosuppressive; immunostimulati, immunomodulatory; antirheumatic; antiALDS; vaccine; cancer; immune; autoimmune disorder; immunodeficiency; systemic lupus erythematosus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13g4 and encodes a protain that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFvs) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such a ALDS and proliferative disorders including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiathinimitic, neuroprotective, antifilammatory, antiathinitic, antiathinimitic, neuroprotective, antifilammatory, antiathinimitic, antiathinimitic, multiple peptide sequence is a single chain antibody variable heavy CDR3 peptide that immunospecifically binds BLyS of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                                                                                                                                                                                                     antibody; B lymphocyte stimulator; BLyS; tumour necrosis factor; B cell proliferation; differentiation; scFv; myasthenia gravis; multiple sclerosis; asthma; rheumatoid arthritis; AIDS; leukaemia; carcinoma; lymphoma; antirheumatic; antiarthritic; neuroprotective; antiinflammatory; antiasthmatic; antiallergic; cytostatic.
                                                                                                                                                                                                                                                                               scFV VHCDR3 peptide that immunospecifically binds BLyS SeqID 3185.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaughan TJ, Hilbert

This invention describes novel antibodies that immunospecifically bind to be Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TMF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomdulatory, antithematic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression
                                                                                                                                                                             BLys; B lymphocyte stimulator; TNF superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulatory; antirheumatic; antiAIDS; vaccine; cancer; immune; autoimmune disorder; immunodeficiency; systemic lupus erythematosus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to Chromosome 1344 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single contains the factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single contains thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As a such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple solerosis, inflammatory captions are useful for identifying immune disorders including myasthenia gravis and multiple solerosis, inflammatory antibolify they can be described as exhibiting various activities such as antirheumatic, antiathritic, neuroprotective, antiinflammatory, antiaschmatic, antiathritic, neuroprotective, antiinflammatory, antiaschmatic, antiallergic and cytostatic. This continued specification, but was obtained in electronic format to disorders in the patient of the printing of the printing of the printing and multiple and propertied of this patent did not form part of disorders in the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              stimulator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antibody that immunospecifically binds to a B lymphocyte stimu (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenee), comprising one of 5481 sequencee (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a bilogical sample. (I) is used to detect Streptococcus in a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or disgnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5481 sequences (51), given in the specification. The proteins have antibacterial and antiinflammatory activity. (1), nucleic acids encoding (1), ABN66044-ABN71526 and the back and that bind (1) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (1) are used to detect Streptococcus in a streptococcus manner. (1) is used to determine whether a compound binds to (1). A composition comprising (1) or a nucleic acid encoding (1), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (1) may be used to recombinantly produce (1) and may be used in gene therapy. Antibodies to (1) are used for affinity contropoccus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.

The present invention relates to novel Streptococcus agalactiae nucleotide sequences (I; ADV87607-ADV87745) and novel polypeptides (II; ADV87607-ADV87745) and novel polypeptides (II; ADV87607-ADV87745) and novel polypeptides (II; ADV87607-ADV87746-ADV895950). The nucleotide sequences encode polypeptides of S. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including purines, prospholipid metabolism, nucleotide metabolism including purines, transcription, translation, protein transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related transposons, blosynthesis of cofactors, proschetic groups and transporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for the abacterial S. agalactise infection. Note: W020029818A2 is equivalent for the present basic patent FR2824074A1. W0200292818A2 contains 6617 sequence whereas the present patent only contains 2344
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gapa

                                                                                                                                                                                                                                                                                                                       mucleotide aguences encode polypeptides of S. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) enclaodism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including purines, pyrimidines and/or nucleosides, regulatory functions, replication, transcription, translation, protein transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related to transposons, biosynthesis of coffactors, prosthetic groups and transporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for treatment of a bacterial S. agalactiae infection. The complete genome of Streptococcus agalactiae is given in ADVB1204. Note: The present patent is an equivalent for the basic patent FR2824074A1, which
                                                                                                                                                                                                                    Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.
                                                                                                                                                                          Kunst F;
                                                                                                                                                                                                                                                                                        The present invention relates to novel Streptococcus agalactiae nucleotide sequences (I; ADV78860-ADV78998 and ADV83341-ADV85476) and novel polypeptides (II; ADV78999-ADV81203 and ADV81205-ADV83340). The present invention relates to novel Streptococcus agalactiae
nucleotide sequences (I; ADV78999 and ADV83141-ADV85476) and
novel polypeptides (II; ADV78999-ADV81205-ADV81205-ADV83340). The
nucleotide sequences encode polypeptides of S. agalactiae involved in the
cucleotide sequences encode polypeptides of S. agalactiae involved in the
cucleotide metabolism including purines, intermediate (central)
metabolism, energetic metabolism, fatty acid and phospholipid metabolism,
cucleotide metabolism including purinies, pyrimidines and/or nucleosides,
crequlatory functions, replication, transcription, translation, protein
transport, adaptation to atypical conditions, sensitivity to medicines
and/or analogues, functions related to transposons, biosynthesis of
cofactors, prosthetic groups and transporters, cell membrane proteins and
cellular machinery. (I) are useful for the detection and/or amplification
of nucleic acids. Pharmaceutical composition comprising (I) or (II) are
useful for treatment of a bacterial S. agalactiae infection. The complete
genome of Streptococcus agalactiae is given in ADV81204. Note: The
present patent is an equivalent for the basic patent FR2824074AI, which
contains only 2344 sequences.
                                                                                                                                                                                                                                                                                                                                      Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.
                                                                                                                                                                                                          Kunst F;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; colon cancer; colon cancer antigen; diagnosis; detection; colorectal carcinoma; chromosome 10.

                                                                                                                                       Cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vecine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased cypression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent carcinomas and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human gastric cancer associated antigen protein sequence SEQ ID NO:1021.

AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precurens (CAAP) respectively. AAB63468 to AAB63722 to AAB63462 to AAB63462 to AAB63722 to AAB63460 to AAB63721 and AAB63722 to AAB63460 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPS have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP entibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,
                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.
                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acres polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polynucleotide of the invention, antibodies against polypeptides of the invention, invention; fusion proteins comprising a polypeptide of the invention; a method for stimulating an immune response specific for a P. acres polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acres polypeptides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies pepcific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            invention relates to an isolated polynucleotide (ACF64435-ACF64733)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Maisonneuve JL;

antigen-presenting cells that express the polypeptide); a method and kit cor antigen-presenting cells that express the polypeptide); a method and kit cor detecting or determining the presence or absence of F. acres in a patient; and a method for inhibiting the development of F. acres in a patient. The P. acres polypeptides, polynucleotides, antibodies, fusion proteins. T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acre vulgaris, or for stimulating an immune response specific for a P. acres or protein. The polynucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acres, or for treating acre timulation of an immune response adjainst P. acres, or for treating acre cand the kit is useful for performing a diagnostic assay. The present cequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acres polynucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element, and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for
preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The AZ-1 gene is located on chromosome log26, and encodes a protein that acts as a tumour suppressor or marker of malignancy progression or reversion. The AZ-1 protein is a tumour suppressor, it interacts with Ecadherin and beta-catenin. The protein has four domains, a serine and proline rich domain (SPAZI), two regions which have immunoglobuline like folds, and a colled-coil domain which forms amphiphathic helices that nucleotide or amino acid sequences are used to diagnose a breast cell malignancy, also for monitoring disease progression, particularly assessment of therapeutic efficacy. The nucleotide sequence is used in vivo or ex vivo gene therapy, and AZ-1 polypeptides are used for treating or preventing breast cancer. AZ-1 polypeptides are also used to raise specific antibodies, for diagnostic detection of AZ-1. Fragments of the

The invention relates to isolated polynucleotide (I) and polypeptide (II)

sequences. (I) is useful as hybridisation probes, polymerase chain

caection (PCR) primers, oligomers, and for chromosome and gene mapping,

and in recombinant production of (II). The polynucleotides are also used

in diagnostics as expressed sequence tags for identifying expressed

genes. (I) is useful in gene therapy techniques to restore normal

cativity of (II) or to treat disease states involving (II). (II) is

cuseful for generating antibodies against it, detecting or quantitating a

cusplement. (II) and its binding partners are useful in medical imaging

cof sites expressing (II). (I) and partners are useful in medical imaging

cof sites expressing (II). (I) and partners are useful in medical imaging

cof sites expressing (II). (I) and jest principle or treating disorders

cof sites expressing (II). (I) and jest products or biological activity. The

polypeptide and polynucleotide sequences have applications in

chapmostics, forensics, gene mapping, identification of mutations

chapmostics, forensics, gene mapping, identification of mutations

cand to produce other types of data and products dependent on DNA and

canno acid sequences of the invention. Note: The sequence data for this

patent did not appear in the printed specification, but was obtained in

clectronic format directly from WIDO at

The A2-1 gene is located on chromosome 10q26, and encodes a protein that acts as a tumour suppressor or marker of malignancy progression or reversion. The A2-1 protein and its variants are tumour suppressors, A2-1 interacts with B-cadherin and beta-catenin. Detecting low levels of A2-1 interacts with amino acid sequences are used to diagnose a breast cell malignancy, also for monitoring disease progression, particularly assessment of therapeutic efficacy. The nucleotide sequence is used in in vivo or ex vivo gene therapy, and A2-1 polypeptides are used for treating or preventing breast cancer. A2-1 polypeptides are also used to raise specific antibodies, for diagnostic detection of A2-1. Fragments of the A2-1 nucleotide sequence are useful as probes or primers for detecting expression of the A2-1 gene

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caction (PCR) primers, oligomers, and for chromsome and gene mapping, and in recombinant production of [II]. The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed consists of (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a colypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and its binding partners are useful for treating disorders of sites expressing (II). (II) are useful for treating disorders of supplement protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and can appear in the printed special sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPD at the printed specification, but was obtained in the will produce the produce of the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

ADC97438 standard; protein; 796 AA.

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence therapy techniques to rescore normal cactivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a colypoptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites involving aberrant protein expression or biological activity. The captures to polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of any produce other types of data and products dependent on DNA and and confidence other types of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from Wilp out
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

Zhou P,
   The invention features to an isolated polynucleotide (AFC6442).

Conciding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a comprising a polypeptide of the invention; antibodies against polypeptides of the invention; antibodies against polypeptides of the invention; an immune response specific for a P. acnes completed of a vaccine composition (comprising P. acnes polypeptides, polypeptides, autibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a cartificat, and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, preventing cells that express the polypeptides are useful for adagnosing, preventing cells that express the polypeptides are useful for dagnosing, preventing cells that express the polypeptides are useful for dagnosing, preventing or treating acne completed or an immune response specific for a P. acnes contains, or for stimulating an immune response specific for a P. acnes contains, or for stimulating an immune response specific for a P. acnes contains an immune response against P. acnes, or for treating acnes and the kit is useful for performing a diagnostic assay. The present contains an immunogenic region. Note: The sequence data for thought to contain an immunogenic region. Note: The sequence data for the contain an immunogenic region. Note: The sequence data for the contain an immunogenic region of the printed specification, but was for the contain an immunoferic format directly from WIPO at form part of the printed specification, but was for the contain an immunofer form part of the printed specific security for the contain an immuno
                                                                                                                                                                                                                                                                                                                                                                                                                                           New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention relates to an isolated polynucleotide (ACF64435-ACF64733)

RESULT 29 AAM40464 ID AAM4 XX

AAM40464 standard; protein; 865 AA.

RESULT 31

```
The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytodratic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous spatem, such as peripheral nervous injuries, peripheral nervous as spatem, such as larged central nervous system disease, such as lazheimer's, Parkinson's disease, Huntington's disease, amyotrophic localised neuropathies and Central nervous system disease, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the ctivinisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotexic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.
                                                                                                                                                             Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Humenerase; hamostatic; amyotrophic lateral sclerosis; Shy-brager Syndrome; chemotactic; chrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ren F, War

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, concoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervopathy and localised neuropathise and central nervous system disease, such as Alzheimer's, parkinson's disease, funtington's disease, amyotrophic C lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity. Amorpactic/Chemokinetic activity, haemostatic C and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C. N.S disorders. Note: The sequence data for this patent did not form

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the invention fraids to an isolated mucieto acts comprising any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(i) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for that has an activity against a biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent compound's activity; (11) a culture comprising strains in which the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the compound collection of strains; or (13) identifying the target of a compound that inhibits constituted for broliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for callular proliferation of an organism. The antisense modeled acids required for callular proliferation of an organism. The antisense modeled acids are useful for content and alsoovery programs. Or for screening or antideted modeled acids are useful for content and acids are useful for several acids are useful for content and acids are useful for several acids are useful for screening acroances are acids are useful acroances.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by the target prokaryotic essential genes. Note: The sequence data for this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzhaimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acids and polypeptides, useful for treating disorders such
patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressent and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Wang D;
, Zhao QA;
utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleic acids and polypeptides, useful for treating disorders such

Zhao QA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM18642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful
         Alzheimer's, Parkinson's disease, Huntington's disease, amyorrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetta activity, haemostatic and thrombolytic activity, cancer disgnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosls; Shy-Drager Syndrome; chemotactic; chrombolytic; drug screening; arthritis; inflammation;

in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous flocalised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         psoriasis; allergy; lupus erythematosus; asthma; cancer; inflammatory bowel disease; rheumatoid arthritis; osteoarthritis; colon cancer; lung cancer; liver cancer; breast cancer; ovarian cancer; prostate cancer; ovarian cancer; prostate cancer; brain cancer; melanoma; liver disease; liver cirrhosis; lung disease; emphysema; obstructive pulmonary disease; haemophilia;

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polymucleotide is useful for treating endocrine/ metabolism-related disease (e.g. obesity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, cepting and inflammatory disorders (e.g. posciasis, allowed), autoimmune and inflammatory bowel disease, rheumatoid arthritis or asthma, inflammatory bowel disease, rheumatoid arthritis or osteoarthritis), cancers (e.g. colon, lung, liver, breast, ovarian, contecative or melanoma), liver diseases (e.g. liver, prostate or brain cancers, or melanoma), liver diseases (e.g. liver, cirrhosis), lung diseases (emphyemma or obstructive pulmonary disease), haemophilia, stroke, or infections (e.g. viral, bacterial or parasitic). These are also useful in develophing powerful assay system for functional analysis of various human disorders, as mell as in diagnostic analysis of various human disorders, as novel human NOV protein trials. This is the amino acid sequence of a novel human NOV protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

whether a mammal will respond or is responding to an anti-cancer agent that modulates cyclin-dependent kinase (cdk) activity. The method comparises measuring the level of one or more blomarkers selected from comparises measuring the level of one or more blomarkers selected from comparises measuring the level of one or more blomarkers selected from comparises measuring the level of one or more blomarkers selected from comparises measuring the level of one to predicting whether patient would be susceptible or resistant to treatment by an agent modulating cdk activity. The invention also describes a method for utilizing individualized genetic profiles for treating diseases and disorders based on patient's response and molecular level, specialized microarrays comprising the biomarkers described, antibodies directed against the biomarkers and cell culture model to identify biomarkers. The cdk modulator is preferably N-5-[5-(1,1-bimethylethyl)-2-cazolylmethyl] hinol-2-thiazolyl-4-piperidine carboxamide, 0.5-therefore sections and preference data for this patent did not form partectly from WIPO at Etp.wipo.int/pubblished pot sequences. This sequence represents a biomarker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                  Biomarkers useful for predicting or determining the response of a mammal to a cancer treatment comprising administration of a modulator of cyclindependent kinase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                              This invention describes a novel method of predicting or determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gynecology and obstetrics; neoplasm; prognosis; tumor marker; DNA library; microarray; expression; TACC2; transforming acidic coiled-coil 2; taxin 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tagett R;

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome sasociated with a human disease, which includes a pathology associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polymucleotide is useful for treating endocrine/ metabolism-related disease (e.g. obseity or disbetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, schizophrenia or depression), autoimmune and inflammatory bowel disease, theumatoid arthritis or asthma, inflammatory bowel disease, theumatoid arthritis or osteoarthritis), cancers (e.g. psoriasis, allergy, lupus erythematosus, asthma, inflammatory bowel disease, theumatoid arthritis or osteoarthritis), cancers (e.g. colon, lung, liver, breast, ovarian, prostate or brain cancers, or melanoma,) liver diseases (e.g. liver, cirrhosis), lung diseases (emphyeema or obstructive pulmonary disease), haemophilia, stroke, or infections (e.g. viral, bacterial or parasitic). These also useful in develophing powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications, and for monitoring the effects of drugs during clinical trials. This is the amino acid sequence of a novel human NOV protein
psoriasis; allergy, lupus erythematosus; asthma; cancer; inflammatory bowel disease; rheumatoid arthritis; osteoarthritis; ootoor cancer; lung cancer; liver cancer; breast cancer; ovarian cancer; prostate cancer; brain cancer; melanoma; liver disease; liver cirrhosis; lung disease; emphysema; obstructive pulmonary disease; haemophilia; stroke; infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  , Gorman L, Li L, Anderson DW, Zhong M;

The AZ-2 gene is a variant of the antizuai-1 (AZ-1) gene (see AAZ90111). The AZ-1 gene is located on chromosome loq26, and encodes a protein that acts as a tumour suppressor or marker of malignancy progression or reversion. The AZ-1 protein and its variants are tumour suppressors, AZ-1 interacts with E-cadherin and beta-catenin. Detecting low levels of AZ-1 nucleotide or amino acid sequences are used to diagnose a breast cell malignancy, also for monitoring disease progression, particularly assessment of therapeutic efficacy. The nucleotide sequence is used in in vivo or ex vivo gene therapy, and AZ-1 polypeptides are used for treating or preventing breast cancer. AZ-1 polypeptides are also used to raise specific antibodies, for diagnostic detection of AZ-1. Fragments of the AZ-1 nucleotide sequence are useful as probes or primers for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

GENERAL INPORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: NUMBER: US/09/328,352

TITLE REFERENCE: GTC99-03P8

CURRENT APPLICATION NUMBER: US/09/328,352

NUMBER OF SEQ ID NOS: 8252

SEQ ID NO 5219

LENGTH: 379
                                                                                                                         Sequence 2, Application US/09573630A

Sequence 2, Application US/09573630A

Patent No. 6713062

GENERAL INFORMATION:

APPLICANT: MERCHANT, JUANITA L.

TITLE OF INVENTION: COMPOSITIONS AND METHODS

TITLE OF INVENTION: COMPOSITIONS AND METHODS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 30, Application US/10092138A

Patent No. 6743630

GENERAL INPORMATION:
APPLICANT: Sato, Taka-Aki
TITLE OF INVENTION: BICCHEMICAL PROTEIN INTERACTION
TITLE OF INVENTION: BICCHEMICAL PROTEIN INTERACTION
FILE REPERENCE: 65823/JPW/PT
CURRENT APPLICATION NUMBER: US/10/092,138A
CURRENT APPLICATION NUMBER: US/206
NUMBER OF SEQ ID NOS: 34
SOFTWARE: PatentIn Ver. 2.1
SEQ ID NO 30
LENGTH: 2843
           COMPUTER READABLE 1939

COMPUTER READABLE Ploppy disk

COMPUTER: Ploppy disk

COMPUTER: TEM PC compatible

COMPUTER: TEM PC compatible

COMPUTER: TEM PC compatible

SOFTWARE: PatentIn Release #1.0, Version #1.25

CURRENT APPLICATION NUMBER: US/08/449,731

FILING DATE: 25-May-1995

CLASSIFICATION: CUNKNOWN>

PRIOR APPLICATION NUMBER: 08/289,548

FILING DATE: 12-A0G-1994

ATPORNEY/AGENT INFORMATION:

NAME: KAGAN, SATAN A.

REFERENCE/DOCKET NUMBER: 1107.46943

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 30, Application US/08681219A
Patent No. 6911556
GENERAL INFORMATION:
APPLICANT: Sato, Taka-Aki
APPLICANT: Sato, Taka-Aki
TITLE OF INVENTION: COMPOUNDS THAT INHIBIT THE INTERACTION BETWEEN
TITLE OF INVENTION: SIGNAL-TRANSDUCING PROTEINS AND THE GLGF (PDZ/DHR)
TITLE OF INVENTION: DOMAIN AND USES THEREOF
FILE REFERENCE: 48962
CURRENT APPLICATION NUMBER: US/08/681,219A
CURRENT FILING DATE: 1996-07-22
NUMBER OF SEQ ID NOS: 37
SOFTWARE PATENTON NOS: 37
SOFTWARE PATENTON NOS: 37
TITLE OF INVENTION: Protein-Protein Complexes and Method of Using Same FILE REFERENCE: 15966-542
CURRENT APPLICATION NUMBER: US/09/538,092
CURRENT FILING DATE: 2000-03-29
PRIOR APPLICATION NUMBER: 60/127,352
PRIOR APPLICATION NUMBER: 60/127,352
PRIOR APPLICATION NUMBER: 60/178,965
PRIOR APPLICATION NUMBER: 60/178,965
PRIOR APPLICATION NUMBER: 60/178,965
PRIOR APPLICATION NUMBER: 60/178,965
PRIOR FILING DATE: 2000-02-01
NUMBER OF SEQ ID NOS: 1387
SEQ ID NO 1007
LENGTH: 2843
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
